Viscosity of NEODOL™ ethoxylates

Viscosity of NEODOL ethoxylates as a function of temperature

The viscosity of a neat non-ionic surfactant is an indication of its ease of pumping. In general, the lower the viscosity at a given temperature, the easier it is to pump. Many non-ionics require moderate heating to reduce the viscosity to a level that is readily pumpable under practical conditions. Figures 1 - 4 show the decrease in viscosity with increasing temperature for four of the NEODOL ethoxylate product lines.

Viscosity of NEODOL 45-7 as a function of temperature

Figure 4
Viscosity of NEODOL 25 Ethoxylates as a function of temperature
Aqueous solutions of NEODOL ethoxylates at room temperature

At room temperature, most non-ionic surfactants form a gel with the addition of water. The table below lists the viscosities of NEODOL ethoxylates at various concentrations in water. This information indicates the ease of formulating with, and handling of, the respective non-ionic surfactant solutions. Since NEODOL 91-6 does not form a gel in water at room temperature, its solutions are normally pumpable fluids at all surfactant concentrations.

Viscosity of aqueous NEODOL ethoxylate solutions (in Centipoise at 22 ºC)
